RESISTOR WASHERS

Resistor Washers are available in a wide variety of diameters to meet your application needs. The washers are utilized for capacitor charge and discharge, crowbar, impulse duty areas, electrical transmission, AC/DC motor drives, and dynamic braking systems. These ceramic composition resistors perform well where high peak power or high energy pulses are required to be handled. These non-inductive resistors are able to dissipate the energy uniformly through the entire resistor body. They can be stacked together, forming a large resistor assembly, to dissipate large amounts of energy. The Contact Surface can be applied using either Aluminum or Brass Materials. An Anti-track coating is available for on the OD and ID of the resistor washers between the contact surfaces.

Part Number plus the Resistance Code is used for specifying a particular part.

- The Resistance code is defined by the first two numbers of the resistance value, followed by a single number multiplier.
- The resistance tolerance (20% is L, 10% is K, 5% is J). When the resistance is less than 10 ohms, the multiplier is not used and replaced by an "R".

For example, the following would be qualified as:

- 3.60" x 0.80" x 0.50" Ceramic Alumina Resistor Washer at 100 ohms +/- 10%
- 4.38" x 0.78" x 1.00" Ceramic Zirconia Resistor Washer at 2.5 ohms +/- 20%
